

Colour Replacement

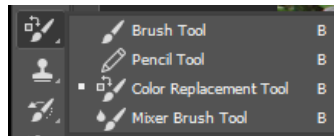

Mendocino College - Digital Image Manipulation with
Photoshop

Adobe Photoshop CC

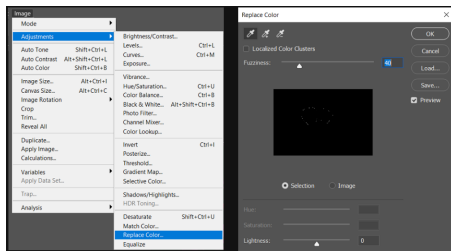

The Color Replacement Tool

- The Color Replacement tool paints over a targeted color with a replacement color.
- good for quick edits, it often proves unsatisfactory, particularly with dark colors and black.
- Uses a foreground color to replace the unwanted color.

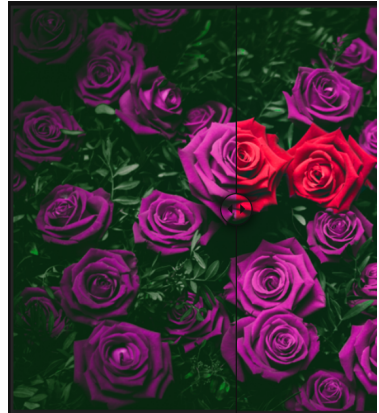

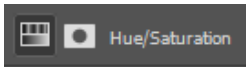

Replace Color Dialog Box

- The Replace Color dialog box combines tools for selecting a color range with HSL sliders for replacing that color.
- Replace Color lacks the Colorize option from the Hue/Saturation adjustment, which may be needed for a complete color change.
- The Replace Color command is good for global color changes, especially changing out-of-gamut colors for printing.

Hue/Saturation

- Use masks and adjustment layers for non-destructive color replacement.
- This is a flexible technique, allowing you to later fine-tune the results with complete freedom.

Using Hue/Saturation adjustment layers to change colours.

- Select the object you wish to change (optional)
- Create a Hue/Saturation Adjustment Layer
- Adjust the Hue slider
