Mendocino College - Digital Image Manipulation with  
Photoshop

Adobe Photoshop CC

# What is Glass Glare?

- Glasses glare happens when light reflects off the lenses of someone's glasses in a photograph.
- Whether you took your picture with a flash or it was just a sunny photoshoot, glasses glare can be an unwanted and distracting addition to your picture.
- There are several options to get rid of glasses glare without compromising your original image.

# How to remove Glass Glare

- Use a selection tool to select the glasses with the glare you wish to correct.
- Use the Clone Stamp Tool to take one part of glasses and paint it over the part of the glasses with glare.
- Then you can use the Healing Brush Tools to finish touching up the glasses.
- Mask the selection, then feather and blur the edges to help blend the pixels with the adjacent pixels.
- Use Adjustment Layers and tweak the settings until the glare fades away.
- Finish up with the Camera Raw Filter to correct bright, hazy glare.
  - Adjust the contrast and brightness of your image to match the glare and make it less visible.
